

## SYSTEM/LOAD CALCULATION INPUT FORM

Before completing this form, we recommend that you watch our short animation film which can be found on our website as it is important that you consider a number of key factors which will enable us to select the most appropriate product and provide a more accurate design and proposal. If you are happy with our estimate and wish to proceed, we will require your Auto CAD drawing for your project and a small deposit before we can produce a detailed system specification and optional energy usage calculation for your property.

We have a network of registered UNICO Specialist Partners who are also on hand to offer additional technical advice and help with your installation from start to finish. Your project will also qualify for our extended warranty period when installed by an approved partner.

Please give careful consideration for the positioning of the UNICO Air Handling Unit and associated duct work. Where possible we recommend the use of a boiler / plant room or adequate loft space to house your key components. Whilst the UNICO System is extremely flexible compared to traditional warm air systems it still needs room to locate the central duct system so please consider your building fabrication, timber joists and cavity walls.
